~~SECRET~~PREFACE

(SNF) This publication has been produced because of the interest shown by various Commands and Agencies, various Offices of the Defense Department and National Command Authorities in estimates of military and civilian casualties as a result of air attacks on North Vietnam. Included are tabulations showing estimated cumulative casualties for both JCS and certain non-JCS targets resulting from attacks on these targets from the inception of the U.S. air strike program to 31 December 1966. Also included is a discussion of the methodology used in estimating these casualties. This publication will be updated and republished monthly.

PART I

INTRODUCTION

1. (C) This publication provides information on the number of military and civilian casualties estimated to have resulted from air attacks on North Vietnam targets. Estimates presented herein have been made by applying casualty experience factors to strike damage determined exclusively from post strike photography.
2. (C) Part II contains the methodology used in making the estimates. Part III is a tabulation of estimated military and civilian casualties resulting from strikes on the respective JCS numbered targets. The targets are identified by name, JCS number, and coordinates. The dates of the photography utilized in analyzing each target are included along with the total strike sorties on the target prior to the time the photography was taken. Part IV is a tabulation of civilian casualties resulting from strikes on selected non-JCS numbered targets. These targets are identified by name, B.E. number, and coordinates. Estimated military casualties are not included, as they are in Part III, since most of these targets are bridges, small railroad yards, and dispersed POL sites wherein the presence of military personnel is unknown. Part V is a tabulation of the total estimated military and civilian casualties reflected in Parts III and IV. Total estimated casualties for certain city complexes encompassing targets listed on Parts II and III are also tabulated in Part V.

1

NO FOREIGN DISSEM

SECRET

WORKING COPY

SECRET

3. (C) All casualty estimates in Parts III and IV are considered applicable for a warned condition. For a primarily unwarned condition it is estimated that casualties would be increased by a factor of ten, and based on this ratio both warned and unwarned totals are included in Part V. Casualty estimates as contained herein include both killed and wounded.
4. (C) It is emphasized that these casualty estimates have been developed only for the targets listed and that the totals are not intended to represent total casualties resulting from U.S. air strikes on North Vietnam. These statistics do not include an estimate of civilian casualties as a result of armed peace except for restrikes of JCS numbered targets as reflected in Part III and armed peace against targets listed in Part IV for which pre and post strike photography is available for interpretation. Also, as the methodology utilized reflects only an estimated average relationship between damage and casualties, casualty estimates cannot be considered precise for any specific target.

PART III

METHODOLOGY EMPLOYED IN MAKING ESTIMATES

1. (SNF) The following two methods were utilized in estimating casualties depending on whether the target is (a) a JCS numbered target with estimates of population in the immediate vicinity available, or (b) a non JCS numbered target with no specific demographic data available.

a. JCS Numbered Targets: This procedure considers casualties which may have occurred in the target and surrounding area within which, theoretically, all bombs dropped should fall. The total area considered includes the delineated target area plus a spillover area within 3 CEP's (Circular Probable Error) of the target area border. A standard CEP of 200 feet was assumed. Demographers developed estimates of the number of military and civilian personnel within both the delineated target area and the surrounding spillover area. Then, in estimating the probable military and civilian casualties, the number of personnel at risk in each area was multiplied by the ratio of the total average lethal area of bombs impacting to the total area involved. If it was discovered during bomb damage assessment (BDA) that some damage accrued to civilian built-up areas outside of the areas discussed above, the methodology outlined in paragraph 1.b. below was used and these additional civilian casualties were added to the estimates developed by the above procedures.

NO FOREIGN DISSEM

SECRET

WORKING COPY

~~SECRET~~

b. Non JCS Numbered Targets: For this category no specific demographic information was available and the following procedure was used in estimating civilian casualties. During the EDA process the number of civilian structures destroyed or severely damaged at each target was tabulated. This number of structures was then multiplied by 0.25 to arrive at the estimated number of casualties. This figure of 0.25 casualties per civilian structure destroyed or damaged is based on data contained in the U.S. Strategic Bombing Survey Summary Report, Effects of Air Attack on Japanese Urban Economy, March 1947. Japanese data was chosen instead of German data because Japanese structures are more closely related to those of North Vietnam.

2. (SNF) The above procedures are considered applicable for a warned condition. As noted in Part I, it is estimated that casualties would be increased by a factor of ten should the personnel be completely unwarned. The 10:1 ratio follows from the fact that the lethal areas for unwarned personnel are approximately ten times as great as those for warned personnel. This is based on the following assumptions: (a) 50% of the unwarned personnel are in the open and 50% are in residential buildings; and (b) warned personnel have protection equivalent to that of a fox-hole or trench.
